

Comments on Climbs at Joshua Tree

by

Roger Linfield

May 9, 2001

The climbs in this writeup, in the 5.7 and harder difficulty range, are ones that I have climbed (or in a very few cases, started up and backed off from). Unless otherwise stated, all the climbs in this list are adequately protected. Route numbers are from Randy Vogel's 1992 guidebook.

The climbs are arranged by my ratings of their difficulty. This is not always the same as the difficulty listed in Randy Vogel's 1992 guidebook or in Alan Bartlett's guidebook. I have made up a list of the climbs for which my rating differs from the published ones.

Because many of the routes at Joshua Tree lie on northeast or southwest faces, it is often difficult to find a climb that receives morning sun (an important consideration on a cold morning). Comments on climbs that get morning sun are therefore included. Comments on climbs that rarely receive any sunlight are also marked ("shaded location"); this information may be useful on hot days. The comments on sunlight are accurate during most of the climbing season: from October until early April. In late Spring, the sun rises so far north that northeast faces receive full sunlight for several hours in the morning. Conversely, climbs that face due south are in the shade for a few hours just after sunrise at this season.

I plan to update this document (mainly adding additional climbs) about once per year. To receive a copy of the latest version, or of a similar one on climbs at Suicide Rock, send me e-mail at
